

Makit - Master is a collection of precision mechanical components which are handy & flexible. These components can be used for building Mechanisms like slider crank, whit worth quick return mechanisms, walking mechanisms and pantograph copying mechanisms and so on. By utilizing these components any body can build verities of machine prototypes & later on it can be transformed in to real working models. Our comprehensive components has wide verities of Machine elements & there is lot of room for the testing of creative ideas and even one can even draw the coupler curves with the help of pencils and drawing boards provided in the kit. Which will be useful for doing lot of research work regarding the mechanisms and their movements instantaneously

Makit - Master is an asset to kinematics, Mechatronics & Robotics labís to carry out all types of project works, experiments & research work using various kit components like links, shafts, spur gears, bevel gears,couplings, etc,.
